Métodos (sistemas quadrados m=n):

- Matriz Inversa $(X = A^{-1}B)$ se $det(A) \neq 0$ (ok.)
- Método de Eliminação de Gauss V
- Método de Eliminação Gauss-Jordan
- Decomposição LU
- Método da Decomposição de Cholesky
- SVD Singular Value Decomposition (opcional)

Eliminação de Gauss:

Introdução/observações importantes:

1) Se a matriz dos coeficientes for do tipo triangular superior

$$\begin{bmatrix} a_{1,1} & a_{1,2} & \cdots & a_{1,n} \\ & a_{2,2} & \cdots & a_{2,n} \\ & & \ddots & \vdots \\ & & a_{n,n} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ \vdots \\ b_n \end{bmatrix}$$

Solução:

$$x_{n} = \frac{b_{n}}{a_{n,n}}$$

$$x_{n-1} = \frac{b_{n-1} - a_{n-1,n} x_{n}}{a_{n-1,n-1}}$$
e assim por diante...

Algoritmo→ Retro-substituição

$$x_{n} = \frac{b_{n}}{a_{n,n}}$$

$$b_{i} - \sum_{j=i+1}^{n} a_{i,j} x_{j}$$

$$x_{i} = \frac{a_{i,i}}{a_{i,i}}$$

$$i = n-1, n-2,...,1$$

Eliminação de Gauss Jordan:

• Síntese do Método: continuar a pré-multiplicar o sistema de equações original (**U'X** = **B'**) **obtido no processo de eliminação de Gauss** por n-1 matrizes **M** (matrizes de combinações de linhas) de forma a tornar a matriz dos coeficientes do "sistema equivalente" numa matriz diagonal.

$$\underbrace{\boldsymbol{M}_{n-1}\boldsymbol{M}_{n-2}\cdots\boldsymbol{M}_{1}}_{\text{Elim. Gauss}}\boldsymbol{A}\boldsymbol{X} = \underbrace{\boldsymbol{M}_{n-1}\boldsymbol{M}_{n-2}\cdots\boldsymbol{M}_{1}}_{\text{Elim. Gauss}}\boldsymbol{B}$$

$$\mathbf{U}\mathbf{X} = \mathbf{B}' \rightarrow \mathbf{U}$$
: triangular superior

$$\underbrace{\boldsymbol{M}_{n-1}^{*}\boldsymbol{M}_{n-2}^{*}\cdots\boldsymbol{M}_{1}^{*}\boldsymbol{U}}_{\boldsymbol{D}}\boldsymbol{X}=\underbrace{\boldsymbol{M}_{n-1}^{*}\boldsymbol{M}_{n-2}^{*}\cdots\boldsymbol{M}_{1}^{*}\boldsymbol{B'}}_{\boldsymbol{B''}}$$

$$\mathbf{D}\mathbf{X} = \mathbf{B''} \rightarrow \mathbf{D}$$
: Matriz diagonal $\rightarrow X_i = \frac{b_i}{d_{i,i}}$

<u> Decomposição LU</u>

• Na eliminação de Gauss

$$\mathbf{M}_{n-1}...\mathbf{M}_1\mathbf{A}=\mathbf{U}$$

- As matrizes de combinação de linhas \mathbf{M}_{i} tem as seguintes propriedades:
 - São triangulares inferiores com 1 nos elementos da diagonal principal
 - A inversa M_i^{-1} é também uma matriz triangular inferior com 1 nos elementos da diagonal principal
 - O produto $\mathbf{M}_{\text{n-1}}...\mathbf{M}_{1}$ é uma matriz triangular inferior com 1 nos elementos da diagonal
 - A inversa de $\mathbf{M}_{n-1}...\mathbf{M}_1$, i.e., $(\mathbf{M}_{n-1}...\mathbf{M}_1)^{-1}$ é uma matriz triangular inferior com 1 nos elementos na diagonal principal ($\mathbf{L} = (\mathbf{M}_{n-1}...\mathbf{M}_1)^{-1}$)
- Portanto:

$$M_{n-1}...M_1A=U \rightarrow A = (M_{n-1}...M_1)^{-1}U \rightarrow A = LU$$

- *• | Decomposição LU
- A técnica de eliminação de Gauss, com relação as operações com a matriz **A**, pode ser vista como nada mais que a decomposição desta matriz no produto de uma matriz triangular inferior **L** por uma matriz triangular superior **U**:

A=LU
